

ITAI 1371 Introduction to Machine Learning
Professor Viswanatha Rao (Vishwa)
Assignment: Lab 05 Data Preparation & Feature Engineering

Group Member Contributions:

Monepha Mitchell

I organized and drafted the group contribution journal. I also reviewed the assignment requirements and communicated with the team to make sure everyone was on the same page and had completed their individual parts. As a group, we discussed the challenges we faced during the lab, such as handling missing data, encoding categorical variables, and scaling features. We shared ideas, answered each other's questions, and helped one another understand the preprocessing steps before completing our own notebooks.

Ved Dalwadi

For module 5, my contributions were that I explained the preprocessing concepts that were in the lab. When I was working on imputation, I helped explain to my teammates the importance of using the median instead of the mean and how this would also be useful in our midterm project. I also explained one-hot encoding, where I explained it like an on-off switch, like binary, where either 1 means it's true, and 0 means it's false. This is how I have contributed to the module 5 assignment

Nigel Bontiff

For Module 5, I contributed by working through the data preparation lab notebook and completing my individual version of the required preprocessing tasks. I focused on understanding how the Titanic dataset needed to be cleaned before it could be used for machine learning, including filling in missing Age values with the median, converting categorical columns like Sex and Embarked into numerical columns, and applying feature scaling to numerical data such as Age and Fare.
